## ABSTRACT

This research was motivated by the lack of innovative design knowledge in the context of social regeneration. Since it is an open and diverse context, facing different methods in different disciplines, designers and the public are on the same platform. It looks for a framework to help them understand new methods and quickly get the rules of operation in various fields in response to changing social regeneration needs. This framework brings together the main methods in each area and spreads them across design stages, giving key elements that people can pick and select, and sort by their attributes. Method analysis and interviews are used to understand the effectiveness, co-design workshops are used to verify the feasibility of the proposed hypothesis.

Through case studies and analysis with multiple design methods in social regeneration and innovation, the research seeks to better understand the role of “design” and “innovation” in the interpretation projects in a modern urban context, and the role of innovation framework in the transforming complicated context to help reach out the most practical strategy. The theoretical framework is based on three concepts: open innovation, social innovation and innovative design thinking toolkit. The framework is structured to help in the social regeneration decision making process to be more replicable, scalable and operable. The outcome will also have positive impact on the related design education fields to help students understand interdisciplinary methods and use them in the complex context.

*Keywords: Design innovation, framework, social regeneration, methods*

## 1 INTRODUCTION

Social regeneration is an intricate field that calls for interdisciplinary knowledge to fulfil the ever-changing trends and arbitrary sequence of demands. Ostensibly, involved in “reshaping” the world, for common people's thoughts, the tough work should deserve government, municipality or the minority to deal with by policy-making or one proposal file. This was not up to the task. Because, complexity is the underlying structure of social regeneration and it challenges people's traditional cognition as well as a subversion of the form of processing. They need to respond to different project scales [1], work with multidisciplinary background people, keep justice of the intricate relationships of stakeholders, seek policy and financial support, etc. It's no longer that achieving the success of regeneration by one decision-maker or one group of people within single discipline at one stroke.

Fortunately, design, which is undergoing rapid change, can provide powerful support for social regeneration. Traditional design was once seen as a craft that calls for the finely-honed intuition of the designer and it is not sufficient for the complex situation nowadays anymore [2]. Apparently, design thinking brings methods, tools, models, and theories into the process of design and makes it logical and evidence-proving [3]. These methods give designers problem-solving clues that disassembling the issues they only dimly know, perceiving the context they are barely aware of, helping them finding insights from the tremendous deposition, testing and creating the solutions that catering all stakeholders. It used to work for small-scale projects, for instance, commercial design, industrial design, etc. However, as long as the complexity and multifaceted influence take place in social regeneration, the organisation and process of design are far beyond one designer's capability. It has

fallen upon the people, who dedicate to make big breakthrough, to draw a blueprint by using interdisciplinary knowledge, consider unmet needs from all stakeholders and gather resources into a system network. And besides, they could be designers, but non-designer people as well.

Furthermore, the other obvious change is the spotlight moving over to public participation. Comparing with the top-down “solo performance” by designers or minority of authorities, nowadays, it seems more successful to create a bottom-up public participating process. People, they are creative enough to design the world in a new collaborate way by using their experience and knowledge [4], even have the power to insurgent the city in a positive perspective [5]. The existing literature focuses on how designers inspire public participate and engage in collaborative design by using the methods in specific design fields, for instance, operable tool kits for sustainable lifestyle in community [6], mutual help group in health system [7].

In the past 40 years, China’s rapid development has provided an unprecedented space for social regeneration design. The emerging new challenges in this country and its greatest capacity of application scenarios for innovation make China an ideal laboratory for practicing new design. Therefore, studying the innovation framework for social regeneration in China is significantly valuable in both practical and educational fields.

## **2 RESEARCH OBJECTIVES**

This research tries to propose a framework that can be spread to the new context of interdisciplinary design and research in the context of social regeneration. It can be applied in design practice, promote integration and communication towards multiple disciplinary, and as Manzini described the form of design knowledge, it must be “explicit, discussable, transferable and accumulative” [8]. So, the feasibility of design thinking and design methods will be highlighted in establishing such an interdisciplinary collaborative process, that will help understanding the context and issues explicitly, opening up multiple possibilities to discuss, forming a discourse system for communication and information transfer, and creating accumulation form for the replication and expansion of subsequent projects.

Simultaneously, the outcome will also work as a tool kit that can be used in social regeneration, for the stakeholders who participate in the social innovation activities, helping them to formulate a design thinking clue to determine the true underlying issues and needs, concatenate a series of evidence, and propose the solution autonomously.

Precisely because creating such a format, participators are able to collaborate with a variety of interlocutors, putting themselves forwards as experts, and considering themselves as part of sticking joint of the interwoven social networks. At this point, the design is more proactive in intervening in social regeneration, and furthermore, cultivating the citizen power along with deepen participation [9].

## **3 PROCESS**

### **3.1 Framework Design**

The framework uses design thinking, design methods analysis and co-design in the construction of methodology. They are applicable to formulating the framework because design thinking provides an iterative flow and clarify the goals of each stage, design methods analysis is a way of screening and applying methods, and co-design engages stakeholders and the public in developing strategies to facilitate social regeneration. We design four steps: (1) defining the open design process, (2) researching on interdisciplinary methods, (3) analysing and screening the design methods by impact factors, (4) screening through handling scenarios.

#### **3.1.1 Define logical and open design process**

It is essential to discuss the logic and openness of the framework at the beginning of the research. A logical design process helps participants to shape up the overall concept and form the phrase goals, without getting lost in the tumultuous exploration. It draws lessons from the double diamond design model, the design thinking model of Stanford University and the IDEO design thinking process, and thus formulate an iterative design process according to the complexity of social regeneration. Moreover, it also points out the participation and co-design opportunities throughout the whole process. Obviously, along with those, all stakeholders and participators will work together and share resources through the open design process (figure 1).

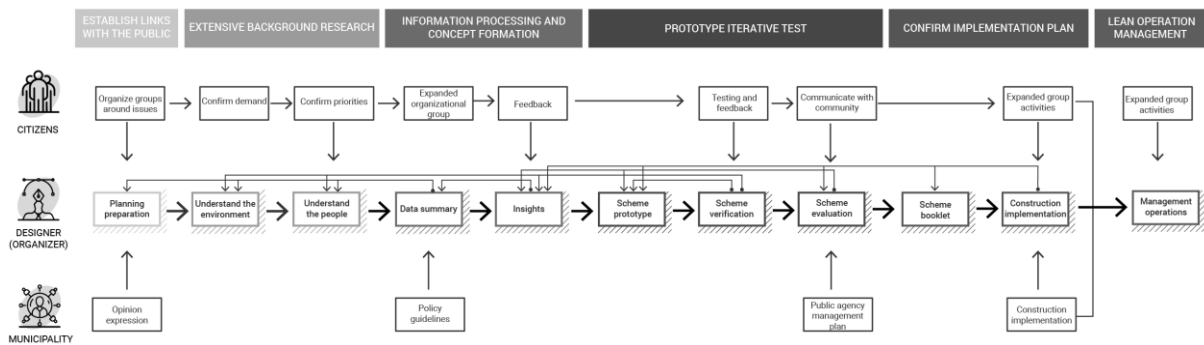

Figure 1. Open design process in social regeneration

### 3.1.2 1<sup>st</sup> round methods screening: from interdisciplinary

Since we cope with a progressively wide range of problems moving beyond traditional design fields, it requires room for expert opinion and theoretical considerations by using array of interdisciplinary tools and methods. We collect and organise innovative tools and methods from 14 works of literature [10-22], which were advanced in the field of service design, social innovation, business innovation, and urban planning. By analysing each of them, the selected methods are classified into six design phases that we defined above.

### 3.1.3 2<sup>nd</sup> round methods screening: from impact factors

Although for each design phase we gathered and analysed the available methods, it was still a dilemma that too many methods to choose, and in turn affects the operability. Moreover, as a complex social regeneration issue, the project's schedule, budget, project positioning, and the participants' own capabilities were all important factors that we cannot overlook. Through case studies and interviews with designers (including urban planners, architects and educators related with social regeneration projects), we defined six impact factors, which are accessibility (simple - complex), usability (novice - expert), flexibility (linear thinking - lateral thinking), the degree of participation (creating - collecting), communication form (non-visualisation - visualisation) and the application context (business background - community environment). Accessibility refers to the degree of effort required by the user, the time may spend, and the personal knowledge input during the practice. Usability, obviously close to the personal knowledge background and capability. Flexibility shows the mode of design thinking, which is target-oriented thinking or open-horizon propose. The degree of participation determines if divergence or concentration is more in line with design expectation. Communication form describes how the design method is presented. The application context is related to the project's background. These impact factors took bipolar as format to present the degree ordering of design methods that have been chosen in each design phase. The second methods screening examples were shown in figure 2.

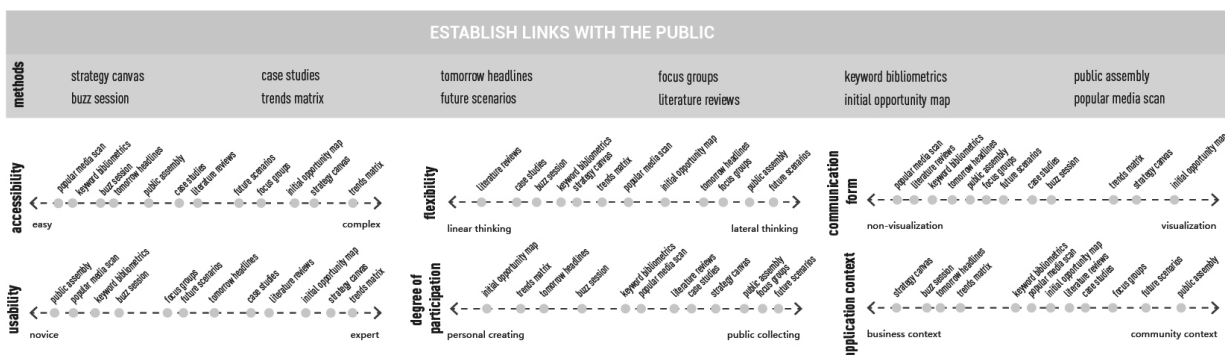

Figure 2. The second methods screening in process 1

### 3.1.4 3<sup>rd</sup> round methods screening: from using scenarios

Even though bipolar screening format seemingly gave the ordering of design methods in different

## 5 CONCLUSIONS

We proposed a framework follows the process of design thinking to foster social regeneration, meanwhile, it is also a method selection guide that explicit, discussable, transferable and accumulative. Six sets of impact factors in complex social relationship updates are defined and the widely selected design methods are ranked by them. Additionally, these factors form a selection guide for using scenarios. For validation, the methods selected through the framework were judged by Hester's evaluation theory. The expert co-design workshop validated the feasibility of the framework and provided testimony for the revision of methods evaluation. The framework and toolkit also act as a visualised tool to help understand interdisciplinary design methods during the design education process in College of Design and Innovation, Tongji University. This paper is a novel approach to social regeneration at a theoretical level as a very early step, and the investigation will continue with rooting in enhancing operability.
